

NAME

imgupd-clean - simple image hosting service cleaner

SYNOPSIS

imgupd-clean [-d *database-path*]

DESCRIPTION

This utility should be used at periodic intervals to clean up the SQLite database. It will remove deprecated images.

Like `imgupd(8)` it can use environment variables or option to specify the database.

Available options:

-d *database-path*

Specify an alternate path for the database.

USAGE

This command should be placed in a cron job (or equivalent) at periodic intervals. Since the minimal lifetime for an image is one hour a periodic job every hour seems appropriate.

Note: make sure to run the cron job in the same user as the `imgupd` service, otherwise you may change file permissions.

Example of cron job:

```
0 * * * * www imgupd-clean -d /var/imgup/imgup.db
```

ENVIRONMENT

The following environment variables are detected:

IMGUPD_DATABASE_PATH (string)

Path to the SQLite database.

AUTHORS

imgupd-clean was written by David Demelier <markand@malikania.fr>
