

**NAME**

**Irccd.Hook** - irccd hook API

**SYNOPSIS**

**Irccd.Hook.add**(*name*, *path*);

**Irccd.Hook.list**();

**irccd.Hook.remove**(*name*);

**DESCRIPTION**

Add, remove and list hooks.

**METHODS**

The **Irccd.Hook.add**() method adds the rule specified by *path* with the identifier *name*. The API does not check the presence of the hook file and therefore can be used before the hook actually exists on the filesystem.

The **Irccd.Hook.list**() method return an array of object for all hooks loaded. Each entry consists of two properties: *name* and *path* which denotes the hook's name and its filesystem path respectively.

The **Irccd.Hook.remove**() method removes the hook specified by *name*.

**EXCEPTIONS**

[Error]                      Thrown from **Irccd.Hook.add**() if a hook with *name* already exists.
