

NAME

links - irccd links plugin

DESCRIPTION

The **links** is used to analyze links sent on channels. It will load the web page and extract its title on the same channel.

INSTALLATION

The plugin **links** is distributed with irccd. To enable it add the following to your plugins section:

```
[plugins]
links = ""
```

USAGE

The plugin will automatically fetch web page titles on message that contains either `http://something` or `https://something`.

Example of possible output:

```
markand: http://example.org
irccd: Example Domain
```

CONFIGURATION

The following options are available under the `[plugin.links]` section:

`timeout` (int) Timeout in seconds before dropping a request (default: 30).

TEMPLATES

The **links** plugin supports the following templates in `[templates.links]` section:

`info` Message to be written when title has been retrieved successfully. Keywords: `channel`, `nickname`, `origin`, `server`, `title`.

BUGS

As HTML pages are not always correct and not openable with a XML parser, **links** actually searches for a `<title></title>` tag using a regular expression. While this is not ideal, it usually works in most situations.

Only a few set of HTML entity characters are converted to the human readable format.
